Guide: Think with AI without letting AI think for you — conText in Grade 12

Nov 10, 2026 · @Manuel Vargas Alegria

This guide shows how conText can be used in a Grade 12 class aligned to the Common Core State Standards; it is not a recommendation to use it with your students right away.

> **Before using it with students under 18.** conText is designed for adults. If you want to run this lesson with students under 18, please write to manuel.var.ale@aideatext.ai first so we can make sure their personal data is handled under the rules that apply to you (in the United States, FERPA and your state's student privacy laws, plus your district's policies). In the meantime, try it yourself with your own material so you see how it works before bringing it to class.

What conText is

conText is a free tutor that does not do the work for the student: it asks one question at a time and draws a map of the ideas in the conversation. Each idea is colored by who contributed it:

- **Blue:** what the student thought.
- **Red:** what the tutor (the AI) introduced.
- **Gray:** what came from the source material.

In one picture, the teacher sees which connections the student built and which came from the machine. At the end, conText produces a PDF summary with the map, the ideas and the full conversation. The tutor answers in the language the student writes in.

Where it fits in the standards

In Grade 12, the lesson works on argument: students defend a venture plan with claims, counterclaims and evidence, in conversation and then in writing. It fits an ELA class, a business or entrepreneurship elective, or a capstone project.

Standard (CCSS, grades 11–12)	What it asks	What conText adds
W.11-12.1	Write arguments to support claims, using valid reasoning and relevant and sufficient evidence	The conversation becomes the rehearsal before writing; the map shows which reasons are the student's own
W.11-12.1.b	Develop claims and counterclaims fairly, pointing out the strengths and limitations of both	The tutor raises the counterclaim ("many competitors: demand or saturation?") and the student answers it
SL.11-12.1.d	Synthesize claims and evidence on all sides; resolve contradictions; decide what more information is needed	"Contradicts" links on the map show each tension and what the student decided about it
RI.11-12.7	Integrate and evaluate sources in different formats, including quantitative ones, to address a question	The tutor asks the student to check their own numbers (cost, margin, repeat purchase) against their claims
W.11-12.1.e	Provide a conclusion that follows from and supports the argument	The PDF summary is the outline for the final written argument

These Common Core statements are published as open data in the Learning Commons Knowledge Graph (v1.16.0, CC BY 4.0), which is how we located them. Entrepreneurship and business courses follow state Career and Technical Education standards that vary by state; the same lesson can be tagged to them locally.

Equivalents elsewhere: Grade 12 in the U.S. is the last year of upper secondary school, like 5.º de secundaria in Peru or the last year of *preparatoria* (bachillerato) in Mexico.

Model lesson: defend your venture plan (90 minutes)

Goal: each team explains in its own words why its venture is viable, sees which part of that reasoning is theirs, and leaves with the outline of a written argument. Each team needs a computer or phone with internet and a one- or two-page plan.

Step	Time	What they do
1. Load the material	10 min	Each team pastes its plan into conText: the problem, the value proposition, cost, price and how it will sell.
2. Talk with the tutor	35 min	The team answers the tutor's questions one at a time, without asking it to write for them. One student types; the team decides each answer.
3. Read the map	15 min	They turn on "My Connections" and count how many blue ideas they connected and which idea connects the most.
4. Revise the plan	20 min	They list what they would change, starting from the questions they could not answer (a missing indicator or cost, for example).
5. Close	10 min	Each team shares one tutor question that changed their mind and downloads the PDF summary to use as the outline of their written argument (W.11-12.1).

Instructions for students:

1. Answer with data from your own plan; if you don't have a number, say so and note it as pending.
2. Don't ask the tutor to write for you: whatever it proposes shows up in red, as the tutor's idea, not in blue as yours.
3. If you disagree with a question, explain why: that also counts as your idea.

A real case: a gummy supplement business plan

On November 7, 2026, Martín, an adult entrepreneur, used conText with his plan to launch a first batch of 200 jars of gummy supplements in Peru (investment of S/ 3,920, projected gross margin of S/ 7,480; S/ is the Peruvian sol). It is the same kind of reasoning this lesson asks of a Grade 12 team.

The plan's figures are illustrative: they were scaled by the same factor to protect the venture's business information. The proportions and the reasoning are those of the real conversation.

Map result	Value
Ideas in total	116
Ideas he connected	59
Links between ideas	147
Unconnected ideas	0%
Most connected idea	Minimum batch of 200 units

Four moments show how the tutor makes him think without giving answers:

1. **Reading one fact two ways (counterclaim).** Faced with “many brands compete,” the tutor asked whether that meant demand or saturation. Martín answered with both readings and placed his brand among the small entrants.
2. **Checking his own numbers (quantitative evidence).** When he proposed reinvesting 70% of the margin and spending 30% on logistics, the tutor pointed out that no profit was left. He kept it as a deliberate bet on growth over 3–6 months.
3. **Changing his mind with reasons (resolving a contradiction).** His first idea was a buy-one-get-one offer from day one. After the tutor asked about bargain hunters, he moved it to month two and then capped it at 20 offers.
4. **Setting his own indicator (what more information is needed).** He set a 50% repeat-purchase rate in month two (50 of the 100 collagen buyers) as the signal that the product works.

In a Grade 12 class, these four moments map onto the standards above: W.11-12.1.b, RI.11-12.7 and SL.11-12.1.d.

How to read the map with students

The map is for conversation, not for grading: it describes one conversation and does not measure learning.

What you see on the map	Question for the team
Many connected blue ideas	Which of these links was hardest to defend?
Many red ideas with no blue links	Which tutor idea did you accept without questioning it?

What you see on the map	Question for the team
Unconnected ideas	How does this idea relate to your value proposition?
The most connected idea	Is it the most important idea in your plan, or just the most repeated?
A “contradicts” link	What did you decide about that contradiction?

What conText does not do: it does not grade, it does not write the plan, and it has not been validated as an assessment tool. The map's numbers describe one session and should not be used to compare students.

For nonprofits and programs

A nonprofit, youth program or community college that supports young or adult entrepreneurs can use conText the way Martín did: each participant defends their plan with the tutor, and the program team reviews the maps to see where participants' own reasoning is missing.

1. **Workshop for your team (45 minutes, free).** We show conText with a real business plan and your team tries it with a project of its own.
2. **Pilot with a group of adult participants (4 weeks).** One session a week on each venture plan; the PDF summaries become evidence of the process.
3. **Report for your program.** With participants' consent, we show how reasoning changed between the first and last session (own ideas, indicators, revised decisions).

If the program works with high school students, the pilot first requires an agreement on handling minors' personal data with the program, the school and the families.
